

## Mozy Data Centers

Serious data protection by Decho.

### THE BIG PICTURE

Each Mozy data center offers a combination of the following:

- Seismic safeguards, bracing, and slider bearings
- Fire suppression systems
- Redundant power distribution units
- Redundant diesel generators
- SAS 70 certification

### Location

Mozy servers are located in several world-class data centers across the globe. Each data center adheres to the highest standards of security for optimal data protection.

### On-site Monitoring and Security

All data centers are surrounded by a secure perimeter and staffed 24/7/365 with technology professionals who maintain the highest standards in data protection. Both card and biometric security authentication are required to enter the facilities and access the Mozy server area. All data centers are SAS 70 Type I or Type II certified.

### Fire Detection & Suppression System

EMC-managed data centers utilize a gas fire suppression system to extinguish fires in the event of an emergency without jeopardizing server functionality. The waterless system releases a mixture of nitrogen, argon, and carbon dioxide to extinguish fires by reducing the available oxygen to less than 15%.

### Redundant Power and Networks

Power is conditioned and protected by redundant systems and guaranteed by generators supplied by diesel fuel storage. In addition, multiple network providers service each data center to ensure operation in the event a network carrier fails.

### Temperature control

All sites have cooling mechanisms in place to ensure the servers are kept at optimal operating temperatures.
